I came to data science the long way, through biology labs in Paris and five years of independent research and art. What I kept from the detour is a habit more than a field: I trust answers I can check, and I try to build things that check themselves before anyone has to trust them. Forecasting keeps a score of how often I am wrong. I am now heading toward formal methods, where that habit is the whole job. I am early on that road.

01 EXPERIENCE

2026
Casablanca

Data Analyst Intern / *OCP Group, Rock Solutions, Finance* — Python · Polars · SQLite · Streamlit

- Reviewed the overdue receivables of the phosphate rock unit's external clients and showed that most of the apparent overdue was likely unmatched credits rather than unpaid debt.
- Built a tested Python pipeline over raw SAP exports that reconciles every total to its source, and delivered a memo with an action plan to finance.

2025
Casablanca

Data Engineer Intern / *Eurafric Information* — Airflow · Hadoop · Python

- Built a complete data pipeline, from ingestion to serving, in a pseudo-distributed environment.
- Orchestrated five data processing tools with Airflow.

2020 – 2024
Paris

Researcher & Artist / *Independent* — Zotero

- Wrote five interdisciplinary research proposals in theoretical ecology, biophysics, nutrition, agronomy and geography, drawing on more than fifty papers.
- Made more than thirty works of poetry, photography and drawing.

2019 – 2020
Paris

Data Scientist Intern / *Pitié-Salpêtrière University Hospital* — R · Bioconductor

- Built an R pipeline to preprocess more than 10 GB of metagenomic data from autoimmune patients.
- Searched the data for biomarkers; the analysis fed into a published clinical study.
- Prototyped ecological network inference to model how microbial communities interact.

2018 – 2019
Paris

Bioinformatician Intern / *Institute of Biology of the École normale supérieure* — R

- Integrated statistical tools into a workflow engine, with unit tests, to make single-cell RNA-seq analyses reproducible.
- Analysed gene expression in immune cell types and prototyped causal models of gene regulation.

02 SELECTED PROJECTS

2026
Enhso/viva

Viva — TypeScript · React · fast-check · Vitest

An oral-style exam built from a student's own JavaScript. Viva mutates the code (a < becomes <=, a `return` disappears), asks the student to predict the mutant's output and how sure they are, then grades by running both versions. A bounded property-based search finds the inputs that tell each mutant apart from the original, and mutants with no such input are dropped. The answer key always comes from execution, never from a model.

2026
Enhso/iw

Intelligence Workbench — Rust · Python · Datalog · SQLite

Turns a research question into a sourced graph of claims and evidence, stored so it can be queried as of any past date. Briefings are rendered by deterministic code that cannot produce a probability by construction, and model-written claims that use forecasting language are dropped.

2026
Enhso/betomcat

Betomcat — Python · GitHub Actions · SQLite

A Metaculus bot entered in the FutureEval Fall 2026 AI forecasting tournament. It researches each question through the Intelligence Workbench, combines forecasts from two models, and runs unattended on GitHub Actions. It never submits a made-up default, and an unmodified template bot runs beside it as a control.

2025
Enhso/cts

Context Tree Switching Python
An implementation of Context Tree Switching (Veness et al., 2012), a sequential prediction algorithm, written as part of research on AIXI.

03 EDUCATION

2024 – 2027

Licence (bachelor's) in Data Science / *International University of Casablanca*
Probability and statistics, algorithms, databases, operating systems and operations research. Independent study: Theory of Computation (MIT), Applied Category Theory (MIT), Real Analysis (Harvey Mudd), Linear Algebra Done Right (U. Washington).

2017 – 2020
left in the final semester

Master's in Bioinformatics / *University of Rouen*
Statistical modelling, algorithms, Markov models and genome evolution, alongside online courses in mathematics for computer science, statistics and game theory (MIT, Yale).

2014 – 2017

Licence (bachelor's) in Life Sciences / *University of Tours*
Calculus, statistics, computer science, biophysics and molecular biology, alongside MIT's online calculus, linear algebra and probability courses.

04 SKILLS

Programming	Python, R, SQL (advanced) · C, Rust, Perl (intermediate) · Java, OCaml, Julia (beginner)
Tools	Polars, SQLite, Airflow, scikit-learn, PyTorch, XGBoost, Streamlit, Git, Docker, GitHub Actions, Claude Code
Practice	Data quality and reconciliation, unit and property-based testing, probabilistic forecasting and calibration (top Metaculus forecaster)
Languages	French (native) · English (fluent) · Arabic (fluent) · Spanish (intermediate)

05 ELSEWHERE

I write essays and poetry in English and French, published at hatimej.com and on Substack.
